

## Do You Know What Deforestation & Climate Change Look Like?

People don't seem to care about deforestation and climate change. It is mainly because they have a hard time trying to understand some of the terms that are used in scientific reports and articles. There is an easier way to show them how these things can affect us, simply by presenting photographs of deforested forests that we've noticed so far. It would make people think more about this topic and they could actually help us somehow.

For example, there has been much done to preserve regions such as the very popular Monteverde / Santa Elena reserve areas. These cloud forests are still threatened by the long term climate effects of deforestation. They are safe from any direct human action but they are not safe from the conditions resulting from the climate change. Deforestation and climate change are often connected. Unfortunately, most people don't know about it so they can't really help.

With more efforts like providing a buffer zone to the Monteverde / Santa Elena reserves and making people realize that climate change and deforestation are often linked, these areas should be able to survive.
